December 11, 2023

Dear Chairman and Board Members:

I am pleased to deliver herewith, the approved Emerald Coast Utilities Authority Capital Improvements Program. This five-year program includes fiscal years 2024 through 2028.

Input during the process of formulating this plan came from the Board, the Citizens' Advisory Committee, members of the public, and the ECUA staff. After holding numerous meetings, the staff developed a plan that clearly expresses the capital needs of the ECUA through FY 2028. The FY 2024 CIP budget provides a programmed approach targeting system repairs along with the Sanitary Sewer Overflow/Inflow & Infiltration (SSO/I&I) Consent Order requirements. The staff has continued making a concerted effort to be frugal with expenditures, which helps to keep annual rate increases as small as possible. Approximately 27 percent of the CIP budget in the Water/Wastewater System for FY 2024 is comprised of projects addressing the SSO/I&I Program in response to the FDEP Consent Order (CO), which the ECUA Board approved in May 2012. This will be the twelfth year of a 16-year program that we have established to make repairs to the system as required in the CO. With "shovel-ready" projects addressing the CO requirements, it is imperative for the ECUA to initiate construction on the affected lines and systems both methodically and aggressively. Additionally, this plan allows for new infrastructure in the system as well.

Shown below is a combined summary, by fund, of the Water & Wastewater System, the Sanitation System, and the Materials Recycling Facility.

COMBINED SUMMARY BY SYSTEM FY 2024-2028  
In 000's

SYSTEM	FY 2024	FY 2025	FY 2026	FY 2027	FY 2028	FUND TOTAL
Water & Wastewater Systems Programs	\$35,400	\$131,028	\$133,603	\$89,163	\$74,704	\$463,898
Sanitation System Programs	6,020	5,600	5,250	5,300	5,300	27,470
Materials Recycling Facility Programs	200	650	650	650	650	2,800
TOTAL	\$41,620	\$137,278	\$139,503	\$95,113	\$80,654	\$494,168

### **Water/Wastewater Systems**

Total new capital improvement requirements for the Water & Wastewater Systems through FY 2028 are estimated at \$463.9 million. Funding in FY 2024 is scheduled to come from existing balances, operating revenues and the Capital Improvement Fee.

WATER & WASTEWATER SYSTEM FY 2024-2028 FUNDS (000)						
	FY 2024	FY 2025	FY 2026	FY 2027	FY 2028	FUND TOTAL
Water Production	\$9,200	\$32,495	\$17,740	\$8,150	\$6,900	\$74,485
Water Distribution	3,750	22,445	27,706	19,392	15,070	88,363
Water Reclamation	0	6,000	16,500	15,500	3,000	41,000
Wastewater Collection	17,100	61,919	64,653	38,810	42,363	224,845
Utility Relocations	0	2,017	3,060	2,590	2,090	9,757
General Projects	5,350	6,152	3,944	4,721	5,281	25,448
Total all programs	\$35,400	\$131,028	\$133,603	\$89,163	\$74,704	\$463,898

### **Sanitation System and Materials Recycling**

Total new capital improvement requirements for the Sanitation Systems through FY 2028 are estimated at \$27.5 million and includes funds for new equipment to serve additional customers, funds to replace a portion of our fleet, and funds to provide equipment replacement for the composting activity. Funding in FY 2024 is scheduled to come from the capital funding fee, operating revenues, and the issuance of debt.

The commercial operation on the mainland includes automated can and roll-off container services.

The composting activity grinds the collected yard waste into mulch, mixes it with bio-solids, and then further processes it into high quality compost. The composting activity keeps yard waste out of the landfill, thereby reducing the cost of tipping fees while the sale of the compost material generates a modest source of revenue.

Capital Improvements Program

FY 2024 – FY 2028

January 3, 2024

Page 3

Capital requirements for the MRF include \$200,000 for equipment upgrades at the facility. The storage modifications are necessary to house replacement parts and other equipment needed for timely repair of the equipment.

SANITATION SYSTEM

FY 2024 – 2028

In 000's

	FY 2024	FY 2025	FY 2026	FY 2027	FY 2028	FUND TOTAL
Containers	\$220	\$800	\$800	\$850	\$850	\$3,520
Transfer Station	0	350	350	350	350	1,400
Vehicles	5,575	3,750	3,750	3,750	3,750	20,575

## **Summary**

These five-year CIP plans, updated annually, ensure the continuing integrity of our operation.

Detail for each of the program descriptions is located within each departmental tab. To assist in your reading of the Data Sheets provided, the following explanations help identify the program area and the type of project listed on the Data Sheet.

Projects are assigned project numbers identifying them as either CIP or Renewal & Replacement (R&R) projects. CIP items expand or add new infrastructure to the utility systems, while the R&R projects enhance and/or extend the life of the existing infrastructure.

### The following prefixes to identify type:

C = CIP project  
R = R&R Project

### The letter following the prefix identifies the functional program area:

A = General Project  
S = Wastewater Project  
W = Water Project  
R = Utility Relocation  
T = Sanitation

The quality of this plan is a testimony to the commitment to excellence and the tireless efforts of all who participated in the process. We would like to express our sincere appreciation for their work toward its successful conclusion.

Respectfully submitted,

*J. Bruce Woody*

**DESCRIPTION:**

ECUA has 28 active water wells, thirteen water storage tanks, four major pump stations and two booster pump stations. The water demand of ECUA customers varies every day throughout the day. To meet these changing demands ECUA's water operators utilize their experience and knowledge to manage the use of all these facilities. With the cost of electricity being a major expense for ECUA it is a constant challenge to run the water production facilities as economical as possible. In order to provide the water operators with a way to optimize the use of these facilities ECUA has entered into a Partnership Agreement with States (PAS) with the United States Corps of Engineers to identify technology to better predict the most efficient and effective use of our facilities Phase I is complete and Phase II is currently ongoing. Ultimately ECUA will have a real time model to indicate what facilities to run at any particular time based on water demand at that time.

**DESCRIPTION:**

The ECUA Water Production department adds hydrated lime to well water for pH adjustment. For many years hydrated lime has been obtained in 50 pound bags. In the past couple of years the availability of bagged lime has gone down while costs have gone up. Due to the escalation of the cost of obtaining hydrated lime in bags and other considerations with the use of bagged lime staff signed a contract with Baskerville Donovan Inc. , one of ECUA's approved Engineering Consultants, to perform a pH adjustment analysis to find the most cost effective to perform pH adjustment in the future. This report indicates that by constructing a bulk hydrated lime plant, ECUA would save funds over the long term. In fact the upfront costs associated with a bulk line plant would be recovered after approximately 5 years. After that a savings of approximately \$500,000 a year would be realized.

### DESCRIPTION:

ECUA has 14 wells with Granular Activated Carbon (GAC) treatment in operation. The carbon that removes contaminants is contained in large cylindrical steel vessels. As these vessels age they have to be repaired or replaced. There are also well sites where there is currently no GAC treatment where carbon treatment may need to be installed requiring the purchase of new GAC vessels.

MAP

The map illustrates the project area, showing a transmission main line and a well. The main line runs from the intersection of Hwy 97 S and Hwy 297A westward along Devine Farm Rd, then under Interstate 10, and westward along Frank Reeder Rd to the intersection of Frank Reeder Rd and Beulah Rd. A well is located near the intersection of Devine Farm Rd and Frank Reeder Rd. Other roads shown include W. Nine Mile Rd, Beulah Rd, and Interstate 10. A north arrow is in the top right corner.

### DESCRIPTION:

In order to provide more water to the Beulah area, a transmission is needed from the 297A/97 intersection westward along 97 to Devine Farms Road then westward on Devine Farms Rod under I-10 and westward along Frank Reeder Road to the intersection of Frank Reeder Road and Beulah Road.

### DESCRIPTION:

ECUA's hydraulic model analysis and associated master plan identify future needs for water production facilities. Prospective sites for these water production facilities need to be identified and evaluated. Actions involved include searching for available properties, research for possible contamination source, conducting appraisals, performance of test wells for proposed well sites, soil borings, property purchase costs and other related items.

**DESCRIPTION:**

ECUA has a well on Davis Highway just south of Burgess Road that has been out of service for several years now due to elevated levels of iron and manganese. With Baptist Hospital building a new campus at I 110 and Brent Lane additional water supply will need to be added to our current water supply to meet the additional demands imposed by Baptist Hospitals new campus. With it's capacity of 2.5 millions of gallons a day, upgrading the Davis Highway Well facility to include treatment for iron and manganese will provide the additional water needed.

### DESCRIPTION:

The existing pumps at this facility need to be replaced along with all of the associated electrical equipment. A variable frequency drive will be installed allowing the new pumps to run at different speeds to allow for better utilization of the ground storage tank and pump station.

This will also include a Pressure Sustaining Valve on an existing line and a check valve installation on an existing water line.

### DESCRIPTION:

A project has been initiated to construct a new bulkhead along the western portion of the existing potable water ground storage tanks on Pensacola Beach. This bulkhead will help protect the existing ECUA infrastructure from erosion and storm damage. As part of the permitting process ECUA is also attempting to reclaim some of the shoreline that is currently eroded away.

<p><b>DESCRIPTION:</b></p> <p>ECUA has thirteen water storage tanks. Comprehensive inspections are conducted every five years on each tank to identify items that are in need of repair or replacement. The tanks are drained, cleaned and evaluated on the inside and outside. In some instances minor repairs are all that are needed and sometimes major work such as total coating replacement is needed. Each tank is also inspected annually for things such as screens, and other minor items.</p>

### DESCRIPTION:

ECUA's West Well water treatment facility (WTF) and GAC filter treatment system are in need of replacement. The site they are currently on is too small to build new state of the art facilities on. Property was recently acquired adjacent to the existing elevated tank site which will provide the area needed to build a new WTF and GAC filter treatment system. The existing well at the existing site is in need of major maintenance. It has been determined that it would be more advantageous to construct a new well at the site of the new WTF, GAC filter treatment system and storage tank. ECUA's Water System Master Plan, most recent edition, recommends that the existing 500,000 gallon elevated tank be replaced with a larger ground storage tank and pump station.

**DESCRIPTION:**

Wells need to be maintained to keep them in good working condition. In order to keep them in good operating condition well pumps and discharge piping are pulled and the well columns are thoroughly evaluated. Well casing and screens are cleaned at the time of the evaluation and any repair work needed is performed. With 31 permitted wells, we need to test and perform restoration work (as required) on 3 to 4 wells per year. This is a continuing project which addresses every well once every 10-12 years.

CITY OF PENSACOLA

Pensacola Bay

GULF BREEZE

Santa Rosa Sound

PENSACOLA BEACH

PENSACOLA BAY WATER MAIN REPLACEMENT

### DESCRIPTION:

During the FDOT's Pensacola Bay Bridge Design-Build project, ECUA had water main relocations at both the north and south approaches. ECUA has been made aware of chlorine degradation over time in HDPE water pipe by local failures. ECUA sent three samples of the HDPE water pipe that was placed out of service during this relocation to be tested. It was determined that the existing HDPE water pipe has signs of chlorine degradation and needs to be replaced. The water main supply the crosses the intercoastal waterway at Bob Sykes Bridge is of similar material and age and should also be replaced. The first phase of this project (CW109 - Pensacola Bay WM Evaluation) will provide the study to replace the subaqueous water mains that provide water to Pensacola Beach. Subsequent phases will provide the Engineering and Construction through this project.

PROP. 16-INCH WATER TRANSMISSION MAIN

N

### DESCRIPTION:

A new 16-inch transmission main is proposed to be constructed down Michigan Avenue from the Mitchell Lane west to Blue Angel Parkway. This is Phase II of IV and is needed in order to supply water to the north and south zones. The existing water mains on Saufley Field Road are undersized. The size restriction of the existing transmission main will prevent the Carriage Hills Booster Pump Station from operating efficiently.

MAP

The map displays a street grid in a coastal area. A dashed line indicates the proposed 24-inch transmission water main route, running north-south along N 14th Ave. The route starts at E Gregory St and extends north towards E Bobe St. A callout box points to this dashed line with the text 'PROPOSED 24-INCH TRANSMISSION WATER MAIN'. To the east of the main route is Bayou Texar, and further east is Pensacola Bay. A north arrow is located in the upper right corner of the map area.

### DESCRIPTION:

A new 24-inch transmission water main is proposed to be constructed along the east side of 14th Avenue from "Little Gregory" Street (the northern 24-inch connection constructed during the FDOT's 17th Avenue Intersection project) to Bobe Street. This proposed transmission main will complete the transmission water main to supply Pensacola Beach with a transmission main and not the smaller distribution mains. Engineering and Surveying shall begin in FY 2023 - 2024 with an anticipated construction to begin in FY 2025.

**DESCRIPTION:**

The Environmental Protection Agency (EPA) proposes regulatory revisions to the National Primary Drinking Water Regulation (NPDWR) for lead and copper under the authority of the Safe Drinking Water Act (SDWA). This proposed rule provides more effective protection of public health by reducing exposure to lead and copper in drinking water. This proposed rule also strengthens procedures and requirements related to health protection and the implementation of the existing Lead and Copper Rule (LCR) in the following areas: Lead tap sampling; corrosion control treatment; lead service line replacement; consumer awareness; and public education. In addition, this proposal includes new requirements for community water systems to conduct lead in drinking water testing and public education in schools and child care facilities.

This project is established to implement the changes required by the EPA. This will be a multi-phase, multi-year project to first collect data on all of ECUA's water services then take appropriate actions as directed by the EPA. The total cost impact will be unknown until such time as the initial study is complete.

### DESCRIPTION:

There is currently a single large diameter waterline from the Pensacola Beach Tank and Pump Station to the main business district around Casino Beach. If failure were to occur in this section of waterline, then an adequate amount of water could not be provided to most of the Pensacola Beach area. This project will result in the selection, design, and construction of a redundant feed from the tank and pump station to Pensacola Beach.

MAP

### DESCRIPTION:

In the summer of 2016, there was a water main break on the existing 8" cast iron water main along Scenic Highway, just south of Langley Avenue. ECUA was able to valve this location off with no customer outages. Due to Gaberonne Swamp, it has been determined more feasible to install a 10" HDPE water main via directional bore. Staff has prepared plans in-house and obtained the FDOT permit to complete the construction.

### DESCRIPTION:

Due to re-occurring line breaks on a water main located along Scenic Hwy (supply main paralleling Spanish Trail Rd), the main has been valved shut. Having wetlands along Scenic Hwy, the addition of a new main on Spanish Trail Rd to take the place of the main on Scenic Hwy was deemed an acceptable alternative. In addition, an existing dead-end main on Spanish Trail Rd would be addressed by this project. The project consists of a South portion (Maygarden Rd north for approx. 1500 feet) and a North portion (Langley Ave to La Mirage). The required work would consist of approximately 4,000-foot of 8-inch PVC water main. A preliminary design by in-house staff has been completed.

### DESCRIPTION:

The Regional Services department is responsible for repair and maintenance of all water meters. In order to improve the service provided to customers and ensure that the revenue generated from the sale of water is accurate, Regional Services has proposed a re-organization of the department to include a Meter Maintenance division. This division will install, test, maintain, and repair all of ECUA's water meters. The current meter repair shop is small and has insufficient space for the two meter repair technicians that use it currently. The Meter Maintenance division will consist of eight meter repair technicians and a supervisor. A new meter repair shop with adequate space to work on meters and storage for meters, spare parts, and testing equipment is critical to the success of the division. Additionally, the meter test bench which is currently used to test the accuracy of meters is outdated and in need of replacement. The current test bench was made in 1972 and as such does not have the capacity to have information entered or stored in an electronic format. This makes setting up a test, documenting results, and archiving those records unnecessarily time-consuming with repetitive data entry. A new test bench would include electronic data entry and record keeping. It would also be designed to meet the current standards for testing the accuracy of the water meter as established by the manufacturer and the American Water Works Association.

This project will result in the construction of a new meter repair shop with sufficient work space for eight meter repair technicians and a supervisor, adequate storage space for meters, parts and testing equipment in a climate-controlled environment, and a new meter test bench.

The project budget includes funds for the engineering required to permit and prepare a site for the shop, design of a new building on property already owned by ECUA or renovation of an existing building, the purchase of workbenches and office furniture for repairs and administrative duties, and a new meter test bench.

CORINNE JONES PARK  
AREA WM UPGRADES

### DESCRIPTION:

The existing water facilities serving customers living on West Romana Street, West Intendencia Street, and West Government Street, between South "A" Street and South Devilliers Street, have been found to be antiquated and in need of replacement. Survey is complete and design efforts (by ECUA staff) are under way. The above provided map indicates the locations for required / proposed upgrades.

The project primarily consists of the installation of approximately 3,600 feet of 4-inch and 2,800 feet of 6-inch PVC water main.

### DESCRIPTION:

This project is the replacement of antiquated cement asbestos (also known as CA or Transite) water mains that have reached the end of their useful life. ECUA has approximately 300 miles of transite main that is responsible for a large percentage of water main breaks and other related problems. Transite water main replacement projects will be prioritized based on several risk factors and history of breaks. This is a multi-year undertaking and is estimated to take 15-years or more to completely replace all of the transite pipe.

### DESCRIPTION:

The area of Scenic Hills CC (Country Club) in Northeast Pensacola is in need of extensive water main upgrades. There is a large amount of transite water main throughout the neighborhood. Breaks have been reported dated back to 2013 and have increased in frequency becoming more periodic in 2015 and 2016. This project will consist of upgrading the water mains, on the roads listed below, to new PVC water mains.

Limits of Ph 2: Tam O'Shanter Rd from Burning Tree Rd to Greenbriar Blvd, Burning Tree Rd, Meadowbrook Dr, Mid Pines Cir & Pine Needles Cir.

**DESCRIPTION:**

The Regional Services Department is responsible for the maintenance of the water distribution system. Throughout the year, there is an effort by the staff to perform preventative maintenance on a portion of the more than 20,000 valves in the ECUA system. This project is utilized to replace water valves that are identified as being inoperable. Due to the size and location of some of these valves, ECUA must use a contractor to perform the valve replacements. By ensuring that the valves in the system are operable, it is possible to limit the size of an area affected by a temporary water service outage for maintenance and to perform the maintenance as efficiently as possible.

**DESCRIPTION:**

The Regional Service Department is responsible for the maintenance of the water distribution system. This annual project will make permanent, structural improvements in the water distribution system that are necessary to prolong the life of the system and provide the best possible service to ECUA's customers. There are examples of the types of improvements that will be completed:

- Replacement of water mains that have exceeded their useful life and now require frequent, expensive emergency maintenance
- Installation of new water mains that interconnect existing water mains in order to address concerns with water supply or quality
- Replacement or upgrade of water meter vaults that are unsafe or have exceeded their useful life
- Replacement of critical water valves have failed
- Replacement of customer's water services
- Purchase of equipment needed to inspect or maintain the distribution system
- Inspection to anticipate problems and preventative maintenance to prolong the life of the system

This is an annual project to make improvements either on an emergency basis or by working through a priority list of critical projects as circumstances dictate. Engineering services will be provided by Regional Services staff or by an outside firm for larger projects. Construction will be completed by Regional Services staff or by a private contractor if needed. Appropriate materials and equipment will be purchased for each project and survey services may be required periodically.

OSCEOLA COUNTRY CLUB VICINITY

The map shows the Osceola Country Club vicinity. A dashed line outlines a proposed project area. The area is bounded by Sandra Dr. to the west, Brenda Ave. to the north, N. 61st Ave. to the east, and N. 58th Ave. to the south. To the east of the project area are several streets: Apache Trl., Seminole Trl., Osage Trl., Mohawk Trl., Cherokee Trl., and Talladega Trl. To the south of the project area is W. Fairfield Dr. To the east of the project area is Mobile Hwy. A north arrow is located in the top right corner of the map.

### DESCRIPTION:

Replacement of existing 6" Cement Asbestos water mains with new 6" PVC water main. The existing 6" water mains will be abandoned in place. Regional Services has informed ECUA Engineering staff of multiple maintenance issues with this area. The needed work will occur in two phases. See below for a list of streets to be worked on in each phase and the approx. footage of pipe to replace.

Phase 1 (58th Ave and westward):

58th Ave - 2,650 LF

60th Ave - 2,650 LF

61st Ave - 1,000 LF

Brenda & Sandra Ave - 4,350 LF

Phase 2 (east of 58th Ave):

Seminole Trl - 2,500 LF

Apache Trl - 650 LF

Cherokee Trl - 3,200 LF

Mohawk Trl - 1,550 LF

Sioux Trl - 1,200 LF

Osage Trl - 1,300 LF

### DESCRIPTION:

There are dead-end lines throughout ECUA's water distribution system that can be eliminated by connections to the existing water distribution system. The purpose of this project would be to identify areas where water circulation can be improved by tying to adjacent distribution lines. A looped system provides better water circulation and can improve both water quality and pressure.

### DESCRIPTION:

ECUA maintenance crews continue to repair leaking water services. The ECUA is responsible for the service from the main to the meter. The majority of these leaks are because of faulty service material. The impact on our operation is cost in overtime to make unscheduled repairs/replacements coupled with customer dissatisfaction from the system outage.

Based on water service failures within ECUA's distribution system, the HDPE service tubing has a life span of approximately 10-years. ECUA has approximately 100,000 water customers that are served via the HDPE service tubing. Regional Services will plan to contract the replacement of 1,000 plus water services per year.

**DESCRIPTION:**

ECUA's water system contains over 65 miles of antiquated galvanized water mains. Many of the mains are small (1-inch - 4-inch) diameter galvanized iron that do not provide for fire protection. In addition, over many years, trace minerals have accumulated on the pipe walls that can significantly reduce capacity and pressure and eventually lead to water quality issues. This program provides for replacement and upgrade of antiquated lines as areas are prioritized and subject to availability of funds.

### DESCRIPTION:

ECUA has about 115,000 water meters in use today. In 2006, ECUA began a transition to an automated meter reading (AMR) system manufactured by the Neptune Technology Group. The AMR system allows a meter reader to collect readings remotely from a passing vehicle instead of reading each meter visually. The AMR register assembly is attached to a standard meter body and transmits the reading via radio frequency to a device in the meter reader's vehicle. The original AMR assemblies purchased were comprised of three separate components a register, a meter interface unit (MIU), and an antenna. There was a mass change out from traditional meters to the new AMR meters after a brief pilot project. Many of the failures began to occur around the same time. This created a backlog of work orders and an immediate need for a large number of replacement assemblies. The issues were due to the failure of the batteries, failure of the wired connections between the three components, and the introduction of moisture into the devices. The batteries are encased in a sealed plastic box that houses the MIU and cannot be replaced or otherwise serviced.

There is a 10-year full replacement warranty on all new AMR register assemblies. After ten years, the cost of the replacement under the warranty is prorated based on the age of the component for another ten years. A 3-piece assembly returned under warranty is replaced with the same 3-piece assembly and the replacement only comes with a 1-year warranty. Neptune offered a new 2-piece assembly to ECUA at a reduced rate to replace those assemblies that were near the end of the warranty period. Either type of register assembly can be attached to the meter body that ECUA uses. The 2-piece assembly is a better product, because it is not as susceptible to water damage. The register and MIU are integrated into one housing and are no longer connected by external wires. The 2-piece assembly is less time consuming to install, more reliable, and gives ECUA the ability to electronically log and review a customer's recent usage history to document leaks and other information for the customer.

A defective assembly must be returned to Neptune for evaluation, so there is a considerable delay before a new assembly is received. A new assembly must be installed when the old one is removed, in order to accurately meter the customer's usage. If the AMR assembly fails, the options are to replace the assembly, read the meter visually or estimate the customer's usage. The visual meter readings are time consuming and impractical with the limited number of meter readers on staff and the estimates inevitably lead to customer dissatisfaction and frustration. All assemblies still under the full warranty are returned for replacement parts.

**DESCRIPTION:**

Over the years, the existing water main on Becks Lake Road, from the well to U.S. Highway 29, has experienced numerous leaks. The existing water main on Stone Blvd has also experienced numerous leaks. To adequately address the problems, the construction of approx. 2,500 LF of 12-inch ductile iron water main would be required. It appears that two sections of railroad track will have to be crossed.

### DESCRIPTION:

The W. Detroit Ave area of Escambia County, shown on the map above with project limits of Caro St (north), US Hwy 29 (west), Interstate 10 (south) & Chemstrand Rd (east), has multiple streets supplied by inadequate 2-inch & 2.25-inch water mains. These long stretches of small diameter pipe supply too many services to be able to provide adequate pressure and flow. The existing substandard lines need to be replaced. New 4-inch & 6-inch mains (with fire hydrants for improved fire protection).

Provided below is a list of streets in this project with an approx. footage of pipe and proposed size for construction:

Caro St - 350 LF (6-inch)	Dudley Ave - 1,575 LF (4-inch)
Orange Ave - 2,725 LF (6-inch)	Hollingsworth Ave - 700 LF (4-inch)
Shaw Ave - 400 LF (6-inch)	Frieston Ave - 350 LF (4-inch)
E & W Barber St - 1,100 LF (4-inch)	Hannah Cir - 750 LF (4-inch)
Satsuma Ave - 1,250 LF (4-inch)	Devane St - 950 LF (4-inch)
Mayflower Ave - 2,025 LF (4-inch)	Page St - 1,000 LF (4-inch)
Juniper Ave - 1,900 LF (4-inch)	Poplar Ave - 1,000 LF (6-inch)
Rawls Ave - 300 LF (4-inch)	E Detroit Blvd - 1,000 LF (6-inch)
Pond Ave - 2,425 LF (4-inch)	Austin St - 1,000 LF (4-inch)
Early Dr - 500 LF (4-inch)	Rouse Dr - 500 LF (4-inch)
Laurel Ave - 825 LF (4-inch)	Faye Ave - 525 LF (4-inch)

### DESCRIPTION:

N. Donelson Street is located downtown east of "A" Street - between Gregory and Garden Streets. Customers on N. Donelson Street, two city blocks that extends over 850' in length, are being supplied by 1.25-inch galvanized waterline. Pressure and flow to these customers is inadequate. The existing waterline is under pavement. Scope of work to include approx. 900 LF of 4-inch PVC water main, one road crossing, and approx. 20 new water services.

MAP

ENGLEWOOD AREA  
WATER LINE UPGRADE

The map shows a grid of streets in the Englewood area. A thick black line outlines a specific project area. The streets shown include W. Fairfield Dr. at the top, W. Leonard St. to the right, W. Boobe St. at the bottom, N. W St. to the left, N. Pace Blvd. running vertically through the center, and N. L St. to the right of the center. A north arrow is located in the top right corner.

### DESCRIPTION:

The Englewood area of Escambia County, shown on the map above with project limits of Fairfield Drive (north), "W" Street (west), Boobe Street (south) & "L" Street (east), has many streets supplied by old 2-inch galvanized water lines. These substandard lines are in poor, tuberculate condition and need to be replaced. Ideally, these upgrades would be completed in conjunction with the Englewood Sewer Expansion - which is planned as a cost-sharing project with Escambia County.

**DESCRIPTION:**

Previously, residents in the Meadson Subdivision approached the ECUA board and requested an upgrade of their waterlines because they are old and undersized. The President of Meadson Roadway Association Inc. expressed concerns about fire protection, low pressure and dirty water. Based on GIS Maps, most of the existing water mains in this area are 3-inch & 4-inch PVC. Portions of the existing waterlines are under the gravel roadways. New lines should be placed out from under the roadways. Waterlines would be installed on Tarkiln Way, Meadson Lane and Meadson Point Road which are currently supplied only by long service lines. Approx. 5,000 LF of new 6-inch water mains and hydrants would be installed, as necessary, to provide fire protection throughout the area. Because the subdivision is unplatted with privately owned roads, rights-of-way and easement issues will need to be addressed.

### DESCRIPTION:

As part of the Pensacola Beach Reclaimed Water System Master Plan, a new Ground Storage Tank and Booster Pump Station has been planned in order to meet the needs of the irrigation cycle on the beach. The storage tank will allow for the diurnal flows of wastewater, which peak during the day, to be treated and stored in the proposed tank so that the reclaimed water may be used for irrigation during the night, when waste flow is low. The project will also help to reduce the nutrient loading into the Sound as well as preserve potable drinking water for human consumption. A site has been chosen south of the existing potable water storage tanks on the Beach. The storage tank is complete and temporarily being utilized for potable water until the necessary line work and booster pump building are complete. The necessary line work and associated infrastructures will be constructed under project CS419A. This project has an ECUA-FDEP Standard Grant Agreement associated with it, which will allow ECUA to be reimbursed for \$4,257,640. ECUA will have to have the multi-phase project completed by October 29, 2025 per the grant agreement.

The map illustrates the project location along the Gulf of Mexico. Key features include Gulf Breeze to the northwest, Santa Rosa Sound to the northeast, and Pensacola Beach Blvd running along the coast. The proposed reclaimed water expansion area is highlighted in green, situated between Ft Pickens Rd and Via de Luna Dr. The Gulf of Mexico is to the south. A north arrow is located in the top right corner.

### DESCRIPTION:

As part of the Pensacola Beach Reclaimed Water System Master Plan, new reclaimed water transmission mains are proposed. One reclaimed water main will extend from the treatment plant to the new reclaimed water ground storage tank located directly south of the existing potable tanks on Pensacola Beach. The other reclaimed water main will extend from the tank back out into the distribution system and extend along Via de Luna before connecting to the existing SRIA 12-inch reclaimed water transmission main in the median of Via de Luna, just past the treatment plant. This transmission main will act as the first distribution main in the reclaimed system that would allow for large commercial users to tie-into. In an effort to save on construction costs the redundant potable water transmission main that was originally proposed under a separate project is being added to the scope of work in this project. This is because of the sensitivity of the construction area and the amount of effort that it will take to construct these facilities within the beach ROW.

### DESCRIPTION:

This project provides for the design, permitting, and construction of upgrades to the Bayou Marcus Water Reclamation Facility. Flows have been increasing and expected to continue with growth on the west side of Escambia County including the development of OLF-8. By expanding the permitted plant capacity from 8.2 MGD to 10.25 MGD, the facility will be able to support the growth.

The last increase in capacity for the facility was in the 1990's. This project will create a new biological nutrient removal facility, filter, and ancillary equipment including piping, electrical, instrumentation, and controls as well as increase the size of reject storage as required by the Florida Department of Environmental Protection.

### DESCRIPTION:

The Central Water Reclamation Facility has limited options when it comes to effluent discharge. Florida Power and Light and International Paper are the two primary users of the reclaimed water with several smaller backup systems that are within ECUA's control. These two primary users are subject to extended outages.

ECUA has performed analysis on discharge options that comply with State and Federal Regulations, have chosen a path forward, and are under preliminary design. Permit application to the Florida Department of Environmental Protection for the effluent discharges will be submitted in June 2023 with an anticipated discharge within ECUA's control of greater than 15 MGD.

The request for FY 2024 will complete design to 100% followed by a two phase construction with a majority of the discharge being constructed in FY 2026 and Phase 2 in FY 2028 if necessary based on operational need.

The map shows a street grid in a city. A callout box labeled 'LEE STREET SEWER' points to a line running horizontally across the middle of the grid. The line starts near N. Kirk St and ends near N. Pace Blvd. The streets shown are N. Kirk St, N. T St, N. Pace Blvd, W. Blount St, W. Lee St, W. Lloyd St, North W St, W. Cervantes St, and Mobile Hwy. A north arrow is in the top right corner.

### DESCRIPTION:

Previously, ECUA completed the East Brownsville Sewer Expansion Project that brought 15-inch sanitary sewer to the Lee Street / "T" Street intersection. Escambia County notified ECUA of intentions to construct sidewalk and improve drainage on Lee Street between N. Kirk Street and N. "T" Street. By partnering with Escambia County, it became possible to get 15-inch sewer west of "W" Street, a major north • south roadway in Pensacola, and to numerous property owners currently utilizing septic tanks. Ultimately, the addition of approximately 3,750 LF of 15-inch sanitary sewer can be constructed as part of this sidewalk / drainage project. ECUA also located approximately 1,500 feet of antiquated 2-inch galvanized water main that should be removed and replaced.

**DESCRIPTION:**

There is no existing means to bypass the large-diameter force main that transmits wastewater to the Central Wastewater Reclamation Facility from the three regional lift stations on Government Street, Moreno Street and Pipeline Road and other lift stations along the route. A bypass is needed for emergency repairs and routine maintenance. This project will commence with a master plan for the construction of a bypass or system of bypasses, then proceed with engineering, land acquisition, environmental assessment, and construction. The engineering firm selected to complete the master plan will review the current hydraulic conditions of this transmission system, then complete the following tasks:

- Develop a master plan for a redundant bypass main or a system of bypasses that would allow for continuous flow of wastewater to the CWRf during average daily flow.
- Determine the appropriate size(s) of the bypass pipe(s) that will be able to function under the existing head conditions during average daily flow in the pipe.
- Identify modifications to the existing infrastructure that would be required to maintain normal flow to the CWRf (e.g. extension of a force main or an additional connection of the force main to the transmission main downstream of an isolation valve that would allow a lift station to continue to function normally during a bypass).
- Review the existing route of the transmission main, then identify and research existing easements, rights-of-way, and private property that might be purchased along the most feasible route for the bypass system. Select the most cost-effective route for the bypass line(s) that would allow for all segments of the transmission main to be individually bypassed for routine maintenance or emergency repair.
- Develop a conceptual estimate of the cost for the overall bypass plan.
- Review the ranking that ECUA assigned for the priority of each bypass around a pipe segment. The ranking is based on the criticality of each segment and the assumed likelihood of failure of the segment. Develop a phasing plan for the overall bypass system project and conceptual estimates for each phase. Each phase should allow for the construction of the phase within the framework of the normal ECUA budget. Each phase should be a complete project and able to function independently of other phases.

The map illustrates the proposed project location. It shows the Inter-coastal Waterway (ICWW) and the proposed route for the RXXXXX PERDIDO KEY REDUNDANT FM, which is shown as a dashed line crossing the waterway. The existing force main (EXISTING FM) is shown as a solid line. The map also indicates the location of Perdido Key and Big Lagoon. A north arrow is present in the top right corner.

**DESCRIPTION:**

A new, redundant 14-inch HDPE force main is proposed to be constructed along the east side of Theo Barrs Bridge crossing the Inter-coastal Waterway (ICWW) via horizontal directional drill. There will need to be additional piping installed on the south side of the ICWW from the west side to the east side via open-cut. The existing force main crossing the ICWW is the sole-source sewer main removing the sewage from Perdido Key.

**PATTON DRIVE AREA  
SEPTIC TO SEWER CONVERSION**

The map shows a grid of streets in the Patton Drive area. A thick black line outlines the project area, which includes the intersection of Patton Dr. and Brigadier St, and extends along Patton Dr. and Brigadier St. The project area is bounded by US HWY 98 W. to the north, Gulf Beach Hwy to the south, and Mills Ave to the west. The project area is labeled 'PATTON DRIVE AREA SEPTIC TO SEWER CONVERSION'. A north arrow is located in the top right corner of the map.

### DESCRIPTION:

The Patton Drive Area Septic to Sewer Project will allow for the abandonment of approximately 200 septic tanks that are located in a watershed that drains to Bayou Grande. The proposed project consists of approximately 9,500 linear feet of sanitary sewer north of Gulf Beach Highway, between Patton Drive and North Navy Boulevard. Topography in the area allows for new sanitary sewer to connect to existing infrastructure without the need for a lift station. The project will cost approximately \$3,850,000. ECUA was awarded a grant from the FDEP which will cover 50% of the project costs, up to \$1,925,000.

NAVY BLVD AREA  
SEPTIC TO SEWER CONVERSION

The map shows a residential area with several streets. A black box highlights a specific area bounded by Alton Rd to the north, Shadow Lawn to the west, W. Navy Blvd to the south, and Chaseville Lane to the east. Other streets shown include Freedom Ln, Pinewood, Bayou Chico, W. Navy Blvd, Meldum Ave, Old Corey Field Rd, New Warrington Rd, Chiefs Way, and Bayou. A north arrow is located in the top right corner.

### DESCRIPTION:

The Navy Boulevard Area Septic to Sewer Project, in the Brownsville area, will allow for the abandonment of approximately 110 septic tanks that are located in a watershed that drains to Bayou Chico. The project limits are north of Meldum Avenue, south of Bloomsdale Drive, west of North / South Pinewood Lane, and east of Ehrmann Street. Due to the topography of the area, the project will consist of gravity sewer and a lift station.

# PROJECT DATA SHEET

BROWNSVILLE AREA  
CONNECT TO LEE ST SEWER

The map shows a grid of streets in the Brownsville area. A thick black line highlights a specific project route. The route starts at the intersection of W. Lee St and N. Green St, proceeds east along W. Lee St, then turns south along N. Green St, and finally turns east along W. Lloyd St. Other streets shown include W. Avery St, W. Mallory St, N. Z St, N. Y St, N. T St, N. S St, N. W St, N. U St, W. Brainerd St, W. Desoto St, W. Gonzalez St, and Mobile Hwy. A north arrow is located in the top right corner.

### DESCRIPTION:

The limits of this proposed project can generally be described as being north of West Brainerd Street, south of West Moreno Street, west of North "U" Street and east of Hollywood Avenue. Topography in the area allows for approximately 165 properties to be served by gravity sewer that will connect to a proposed gravity trunk main on West Lee Street. The gravity trunk main has already been designed and will be constructed as part of a project being done by Escambia County.

### DESCRIPTION:

ECUA has identified multiple “un-sewered pockets” where sanitary sewer can be installed and connected to existing sanitary sewer mains. The proposed work area extends from North “P” Street to North “U” Street and from West Desoto Street to West Jordan Street. The project goal is to allow for the abandonment of approximately 150 septic systems by providing public sewer to areas where the existing sanitary sewer system can be extended without the use of a pump station.

**DESCRIPTION:**

ECUA's Sewer Expansion Program is focused primarily on eliminating existing septic tanks which may be negatively impacting local surface waters (creeks, bayous, etc.) causing public health concerns, or impacting potable water sources. This budget may also supplement ECUA's Septic Tank Abatement Program that is aimed at preventing proliferation of new septic tanks especially in the southern portion of Escambia County which is normally funded through CIP CA001 -Oversizing. New development south of Well Line Road is required to connect to the ECUA sewer system subject to certain financial limitations. The project is intended to provide funding to address the needs of these two programs. Many neighborhoods that are currently served by septic tanks have been identified and will be considered for sewer expansions as funds become available. Projects will be prioritized based on available funding, history of septic system problems, proximity to water bodies, customer participation, etc.

### DESCRIPTION:

In an area where a customer is abandoning an active septic tank and connecting a force main, ECUA will consider participating in the cost of the grinder pump station. This will include the wet well, pumps, controls, etc., but not the installation costs. Limit of cost-sharing is \$1,500 per installation.

**DESCRIPTION:**

The Beach Haven NE Phase 2 project is proposed to provide gravity sewer service to approximately 400 properties located on the north side of Gulf Beach Hwy, specifically in the area located east of Fairfield Drive, north of Gulf Beach Hwy, west of Colbert Ave, and south of Cravatt St.

ECUA has entered into an interlocal agreement with Escambia County to have new sewer collection facilities constructed in the County's contract.

**DESCRIPTION:**

The area to be included/addressed is primarily west of Stockdale Avenue, north of Johnson Avenue, east of Fab Street and south of Ensley Street. Required work in Phase 1 will consist of one new regional lift station, new 10-inch force main constructed from the new lift station, down Hitchcock Dr to the transmission main crossing on Salem Dr, and gravity sewer on Fab Street, Ensley Street, and Spencer Avenue. Sewer is designed for construction on Stockdale Avenue also, but, depending on cost, may have to be held for Phase 2.

Water upgrades will also be included in this project - predominately replacing existing transite water main on Hitchcock Drive and Salem Drive.

### DESCRIPTION:

To procure additional emergency generators. Provide additional emergency backup power to sewage lift stations and water well facilities. Major storms (tropical storms, hurricanes, etc.) often cause numerous extended power outages at our sewer lift stations. Immediately following Hurricane Ivan the majority of our lift stations were without power. In some cases power wasn't restored for over a week. The purchase of additional portable generators would eliminate spills and reduce the recovery time following extended periods of power loss.

MAP

LS #14 REROUTE TO CWRP

The map illustrates the proposed reroute of Local Street #14 (LS #14) from its current location on Addison Dr. to a new location on Denton Rd. The reroute is shown as a thick black line. The map includes several streets: Hillview Dr. to the northwest, E. 9 Mile Rd. to the west, N. Davis Hwy running north-south, Copter Rd. running east-west, and Addison Dr. running northeast. Other landmarks include UWF (University of West Florida) to the north, ECUA (Escambia County Utilities Authority) to the east, and Escambia Bay to the northeast. A north arrow is located in the top right corner. A dashed line labeled 'EXIST. 8" FM' indicates an existing feature. A box labeled 'LS #14 REROUTE TO CWRP' is placed near the top of the reroute. The new endpoint of the reroute is marked with a small box labeled 'LS' and 'ELLYSON LS #14'.

### DESCRIPTION:

This project will consist of approximately 9000' of new 16" force main from lift station #14 up Addison Dr. to Denton Rd., across Nine Mile and Davis Hwy. and connecting with the existing 8" force main on the UWF campus. The new force main will provide a direct connection through lift station # 11 on Greenbriar Rd. to the northern transmission main at Pate Dr. The upgrade of the 8" force main to a 16" is anticipated.

### DESCRIPTION:

The area to be addressed (roads numbered and listed above) is primarily west of Stockdale Avenue, north of Johnson Avenue, east of Airway Drive, and south of Smiley Avenue. Phase 2, needed to expand the sanitary sewer system constructed in Phase 1, will construct sewer in the right-of-ways of the roads listed above and sewer laterals to each property for future connection by the property owners. The estimated cost of construction is approximately \$4,000,000.

There will also be water upgrades incorporated in Phase 2 - primarily addressing antiquated, galvanized lines that need to be upgrade for water quality / quantity along with providing fire protection to the surrounding areas. A portion of 6-inch transite will also be replaced along Johnson Avenue.

MAP

### DESCRIPTION:

The Atwood area, located in the vicinity of the Davis Hwy / I-10 intersection (Kipling St to the east, Ira Dr to the west, I-10 to the south & Olive Rd to the north) is not fully served by an ECUA gravity sewer system. Many residents are currently on septic tanks for sewer needs. The project will consist of the construction of new gravity sewer mains to accommodate the residents of Atwood currently without ECUA sewer service. It is assumed that construction would have to occur in phases - Ph 1 being east of Davis Hwy (\$2,500,000) and Ph 2 being west of Davis Hwy (\$1,500,000). A new lift station would be needed in each phase.

### DESCRIPTION:

Provide gravity sewer service to approximately 600 properties located in an area west of Navy Point. This area is immediately adjacent and upgradient of Bayou Grande and contingent wetlands. To minimize impacts to roads and property, ECUA's sewer project should be completed as part of a future roadway / drainage improvement project being planned by Escambia County. ECUA has purchased property (511 Gordon Ave) for the construction of a lift station of adequate size necessary for flows generated in this region.

Time for construction is dependent on the County and available funding. Limits of construction will be impacted/reduced near Gulf Beach Highway due to wetlands and topography changes.

ENGLEWOOD SEWER EXPANSION

**DESCRIPTION:**

Large portions of the Englewood CRA area do not currently have an ECUA gravity sewer system constructed. A project is required for the construction of new gravity sewer mains to accommodate the residents of Englewood currently without ECUA sewer service. The majority of the new construction / service area proposed is within the following boundaries: "E" St to the east, "W" St to the west, Avery St to the south & Yonge St to the north. Some existing sewer is in the region - new sewer will be connected to existing sewer where feasible. A new lift station may be needed to fully serve customers in the area defined above. This project is planned to be constructed with funding participation from Escambia County.

TOTAL 610,000	

**DESCRIPTION:**

Water Reclamation operations staff haul approximately 4.5 million gallons of sludge each year in 6,500 gallon tanker trucks from the Pensacola Beach WRF down the highway. This equates to 700 round trips from the Central Water Reclamation Facility to the Pensacola Beach Water Reclamation Facility each year.

This project is designed to thicken the sludge at the Pensacola Beach Water Reclamation Facility similar to the operational procedures already in place at the Bayou Marcus WRF. By increasing sludge concentration from 1.5% solids to 4.5% solids, only 250 trips will need to be made to Pensacola Beach each year decreasing wear and tear on vehicles, driver overtime requirements, and liability from driving 80,000 pound tanker trucks down the highway. It also increases operational adjustability to deal with variables such as hurricanes, bridges being out of service, and Pensacola Beach events.

An alternatives study has already been completed and several drum thickeners similar to the one at the Bayou Marcus WRF have been assessed for operation at the Pensacola Beach WRF.

Design, permitting, and equipment purchase are anticipated in FY 2024 with construction in FY 2025 due to the long lead times of acquiring materials.

DESCRIPTION:
<p>There is an existing sewer line that was constructed as a part of Village Oaks Shopping Center. The line was constructed and in service before it was realized that it was on an out parcel to the rear of the Village Oaks property. A business was built on this property in 1996. The sewer line is within 5 feet of the building. Rerouting this sewer and abandoning the section of the out parcel will remove any maintenance problems the existing line may cause by being located so close to the building.</p>

A map showing the location of the Bayou Marcus Water Reclamation Facility. The facility is indicated by a black rectangle. A callout box points to this rectangle with the text "BAYOU MARCUS WATER RECLAMATION FACILITY". The map includes several streets: ALEKAI DR. running diagonally from the top left, N. BLUE ANGEL PKWY running vertically, and MULDOON RD running diagonally from the top right. The facility is located near the intersection of N. Blue Angel Pkwy and Muldoon Rd.

### DESCRIPTION:

Engineering and construction of an influent emergency storage tank at Bayou Marcus Water Reclamation Facility. The tank is proposed to be 6 million gallons in capacity and will install additional valves and piping for the independent operation in case of emergencies at the plant.

**DESCRIPTION:**

Sanitary sewer lateral rehabilitation within the public right of way for the CAP is an annual renewable contract. The contract is ECUA's means of replacing lampholes with new manholes or new lampholes if a manhole cannot be installed that allow pipe lining; to make point repairs where needed on mainline and lateral pipes; to line laterals within easements and rights of way as needed; restore surfaces; and clean and provide CCTV video of pre and post work completed under the contract. At sunset of the contract, the project is to be rebid and continued.

### DESCRIPTION:

I & I are contributing factors to sanitary sewer overflows (SSOs). ECUA has been under a DEP consent order since 2012, requiring a comprehensive evaluation of the ECUA collection system, and subsequent repair and rehabilitation aimed at reducing SSOs. ECUA's Capital Improvement Program has included a project for I & I reduction since 2006, and continues to use this project as the vehicle to address sewer rehabilitation, and ensure compliance with the consent order. This is a multi-phase, multi-year project to identify, quantify, and correct sources of I & I in the collection system. Work includes the installation of temporary and long-term flow monitors, physical assessment of gravity mains, force mains and lift stations, development and calibration of a hydraulic computer model to assist in the prioritization of work and rehabilitation efforts, and to identify and fund future CIP projects.

The first of three phases of the consent order has been completed, namely the comprehensive evaluation of the system. The information derived from this effort formed the basis for identification of priority rehabilitation projects, to be completed over a ten-year period (known as the Corrective Action Plan). The main elements of the Corrective Action Plan are mainline points repairs (500) and lining (270 miles), lateral point repairs (3,700) and lining (18,500), replacement of 6-inch gravity mains (10 miles), force main replacement (65 miles), manhole rehabilitation (5,600) and replacement (450), lift station replacements and upgrades (50), emergency storage tanks (3), and construction and rehabilitation completed over the last several years. ECUA is performing work consistent with the Corrective Action Plan.

**DESCRIPTION:**

The Government Street Regional Lift Station (GSRLS) Emergency Storage Tank project is the highest priority project listed in the Florida Department of Environmental Protection approved Corrective Action Plan for ECUA. This project will be designed and built on land to be purchased for an emergency storage tank for sanitary sewer for CWRf transmission main interruptions and other emergencies to reduce sanitary sewer overflows. A 10 million gallon storage tank is desired to meet an average day flow from the GSRLS and attenuate flows during storm events to prevent or significantly reduce sanitary sewer overflows.

### DESCRIPTION:

The Hammocks Subdivision is a proposed 99-lot residential subdivision located south of the intersection of Helms Road and Beulah Road. The subdivision sewer service will be a combination of gravity sewer and low-pressure force main, all serviced by one lift station. The force main from the proposed lift station would connect to an existing force main located near the intersection of Helms Road and Beulah Road with two existing lift stations connected. To accommodate the additional flow from the proposed Hurst Hammock Subdivision lift station, approximately 4,500 feet of the existing 4-inch force main needs to be oversized to an 8-inch.

A nearby lift station, Woodlyn Meadows Lift Station (No. 397), was slated for upgrades using \$105,000 collected from a developer in coordination with another previously approved system extension project, the Lakeside Preserve Subdivision. Per the executed Utility Service Agreement between ECUA and the Hammocks Subdivision developer, ECUA will no longer need to upgrade LS No. 397 since the developer has agreed to construct the needed 8-inch force main. Additionally in the Utility Service Agreement, ECUA has agreed to contribute \$105,000 for oversized force main construction using the previously collected funds.

### DESCRIPTION:

The Hammocks Subdivision is a proposed 99-lot residential subdivision located south of the intersection of Helms Road and Beulah Road. The subdivision sewer service will be a combination of gravity sewer and low-pressure force main, all serviced by one lift station. Vicinity lift station capacity was reviewed during the review of the Hammocks Subdivision system extension project. It was determined that constructing approximately 600 linear feet of 4-inch diameter force main along Farmers Road would increase capacity and performance for the Williams Place Lift Station (No. 287) by allowing sewer flow to bypass nearby Weavers Run Lift Station (No. 392), which would ultimately increase ECUA sewer system capacity and allow emergency bypass operations.

### DESCRIPTION:

The Regional Service Department is responsible for the maintenance of the wastewater collection system. This annual project will make permanent, structural improvements in the wastewater collection system that are necessary to prolong the life of the system and provide the best possible service to ECUA's customers. There are examples of the types of improvements that will be completed:

- Repair or replacement of gravity sewer mains that require routine maintenance due to defects
- Installation of short extensions of the collection system to improve its effectiveness
- Repair, replacement, or upgrade of existing air release valves (ARVs) or the installation of new ARVs
- Repair or rehabilitation of defective manholes
- Maintenance or replacement of check valves and vaults that house them
- Replacement of critical valves in force mains that have failed
- Replacement of sewer service laterals that fail in locations where ECUA is responsible for maintenance
- Purchase of equipment necessary to inspect or maintain the collection system
- Inspection to anticipate problems and preventative maintenance to prolong the life of the system

This is an annual project to make improvements either on an emergency basis or by working through a priority list of critical projects as circumstances dictate. Engineering services will be provided by Regional Services staff or by an outside firm for larger projects. Construction will be completed by Regional Services staff or by a private contractor if needed. Appropriate materials and equipment will be purchased for each project and survey services may be required periodically.

DESCRIPTION:
<p>The existing 10" ductile iron force main from the Lincoln Park lift station (No. 10), which runs under U.S. 29 and Olive Road, has been in service for approximately 30 years. At present, over 500,000 gallons of sewage passes through the 10" ductile iron force main each day. The line is a safety concern because hydrogen sulfide gas is damaging the existing ductile iron pipe and it has been repaired numerous times over the years. This project will consist of installing over 12,000 L. F. of new 12-inch force main-by various methods including direct bury, pipe bursting, jack and bore (for crossing railroad tracks at U. S. Hwy. 29), etc.</p> <p>This project also includes \$500,000 for 1,300 LF of 4-inch antiquated water line replacement in a section that continues to break and need repairs and \$500,000 for additional water work throughout project scope.</p>

### DESCRIPTION:

In June 2020, ECUA received a system extension project, for the Heron's Landing Master Plan Development located at 951 Dog Track Road, requesting to connect to ECUA's water and sewer system. The project will consist of the construction of approximately 184 single family homes, 144 townhomes, 288 apartments, and a 48,000 square foot commercial building. After evaluating options for sewer and water connections and having models performed, no water infrastructure upgrades were required. However, to allow the Development to connect to an existing 8-inch force main on Dog Track Road, a majority of the current sewer flow in the 12-inch force main on Bauer Road would have to be redirected from Lillian Highway to Sorrento Road.

Since a minimal amount of sewer flow would still be going north toward Lillian Highway, ECUA requested that Heron's Landing Development LLC install a new 4-inch force main along Bauer Road and transfer all the existing services off of the 12-inch force main to prevent potential maintenance issues. ECUA agreed to cost-share for approximately 2,250 feet of 4-inch force main on Bauer Road. Additionally, the existing 8-inch force main, owned and maintained by ECUA, that is currently located in an easement on 951 Dog Track Road is antiquated and breaking frequently. ECUA also requested that the replacement and relocation of approximately 1,640 linear feet of 8-inch force main be included in the project through ECUA cost-sharing.

### DESCRIPTION:

The existing 4-inch PVC force main from the Green Street North lift station (No. 24), which runs from Garnet Street 4,200 L.F. to North U Street, was constructed with blue PVC pipe normally reserved for water mains. The line is a safety concern because of the potential for a cross connection between the water and sewer system. This project will consist of installing over 4,200 L. F. of new 4-inch force main-by various methods including direct bury and jack and bore (for street crossings).

This project also includes approximately \$500,000 for 2,800 LF of new 4-inch water mains to replace antiquated water lines within the project area.

### DESCRIPTION:

ECUA Lift Station #113 is located behind an existing 16 unit residential development along Blanton Court. This lift station only serves the development and is difficult to access since it is positioned behind the development. There is currently an ECUA sanitary sewer manhole less than 500 feet south of the lift station. The purpose of this project is to eliminate Lift Station #113 by converting the lift station to a manhole and constructing a new gravity sewer system between the lift station and the existing manhole. The new gravity sewer system will need to pass through private property and an Escambia County stormwater pond area. Permanent easements will be required from property owners and Escambia County.

**DESCRIPTION:**

The ECUA Engineering staff developed the Downtown sewer upgrades plan, which is vital to complete sewer rehabilitation work in accordance with the Florida Department of Environmental Protection (FDEP) Amended Consent order and to meet the requirements in the associated Corrective Action Plan (CAP). These sewer upgrades will replace existing 6-inch clay pipe with 8-inch diameter PVC pipe to increase capacity and reduce I&I. This reconstruction work will complete sewer rehabilitation efforts in the Bruce Beach area and the A4 and A4A basins. Staff reviewed and identified antiquated water mains in parallel to existing 6-inch diameter gravity sewer main pipe that will be replaced and noted water mains that also need to be upgraded. These water mains will be replaced to meet the needs of the water system and remove antiquated water mains from service.

**DESCRIPTION:**

This program was originally designed to bring all lift stations up to our design standard, which will speed up replacement and reduce costs. It is now required to upgrade lift stations to accommodate new growth and repair or replace pumps that are worn out or undersized and in need of upgrading. This program is part of a preventive maintenance program that is being carried out by the Lift Station Division. This program is targeted towards the small and medium size pumps. However, the pumps at our larger critical stations are also being repaired or replaced due to wear and age as a part of this project. We have over 379 lift stations with more than 600 pumps in our system. With an average life expectancy of 15 years, we need to plan to replace as many as 40 pumps per year. As growth is continuing, many stations must be upgraded. This is particularly true of stations which repump the sewage from several smaller stations.

### DESCRIPTION:

ECUA's sanitary sewer collection system includes approximately 380 active lift stations. Many of these lift stations are in poor condition and in need of major repair or replacement. Many of these older, un-lined, concrete wet wells have deteriorated and need to be replaced with much more corrosion resistant fiberglass wet wells. Projects may also include more efficient pumps, pump guide rails systems which facilitates safer pump removal, and/or new electrical control panels. The lift stations to be addressed includes, but is not limited to, the list below:

LS#	Name	LS#	Name
105	Canterbury Woods	62	Creighton/Scenic
52	Carrollwood	70	19th and Blackshear

### DESCRIPTION:

The Engineering Department has been working with Kenneth Horne & Associates on the abandonment of Lift Station 58 and the work associated with connecting the Lift Station 58 to the Lift Station 57 site via a new gravity sewer main. Originally, this project consisted of upgrades to the existing Lift Station 58 and in a separate project. Constantine Engineering was hired to handle the engineering services related to the replacement of Lift Station 57. During the design it was realized that Lift Station 58 could be completely abandoned and connected to Lift Station 57 with a new gravity sewer main. The scope for KHA was altered to include abandonment of the existing Lift Station 58 and design of a new gravity sewer main to Lift Station 57 as well as the associated return force main. Now, these originally separate projects are dependent on each other and it has been decided that transferring all engineering services to one party and combining the scopes of these projects would be the most feasible way to move forward with the project. This project is noted in the Corrective Action Plan.

### DESCRIPTION:

L/S # 107, called the Charbar lift station, is located on Mobile Hwy. approximately 750' west of Massachusetts Ave. The existing lift station wet well, pumps, access road, etc. are in a flood prone area. The facilities have been damaged in the past due to high flood water elevation. While reviewing the job site, staff has found that a gravity sewer pipe and a force main pipe are exposed in the bottom of an adjacent creek. This project is required to replace exposed pipes and conduct needed safety, code related improvements to the lift stations. The current plan is to purchase the neighboring property and construct a new lift station to the east of the existing lift station and prepare the new lift station and equipment to resist flooding.

### DESCRIPTION:

L/S # 96, located on Pine Forest Road approximately 1/3 miles north of Five Flag Speedway, is located in a flood prone area and has been totally submerged during past rain events. During major rain events, crews must wade through water to get to the lift station. Also, due to the lack of an established access road, ECUA crews have to cross private property to access the site. This project is required to : (1) provide an adequate access lane and driveway to the site on Pine Forest Rd., (2) raise the lift station top to prevent over topping, and (3) conduct required safety/code related issues.

The map displays a proposed water main alignment. It begins at the Detroit Blvd Lift Station (LS 50) and runs east along Detroit Blvd. It then turns south, crossing Interstate 10, and continues along Untermyer Ave. The Lincoln Park Lift Station (LS 10) is located on this southern segment. Pine Forest Rd is shown to the southwest of the alignment. The map includes various street names and landmarks, such as the intersection of Detroit Blvd and Interstate 10, and the location of the lift stations.

### DESCRIPTION:

The older station is located in the Detroit Blvd. ROW, adjacent to the road itself, which provides unsafe conditions for repairs and maintenance due to the limited space and vehicular traffic. Also, the station is located next to a bridge/creek that floods regularly, to include flooding the lift station and making access impossible. The collection basin sending sewer to the station experiences high I & I, therefore the station may also require pump upgrades. The entire area is experiencing rapid development and the sewer system can not receive additional sewer as it is at capacity. Property in the Detroit Manor Subdivision was purchased for a suitable lift station site. Proposed with the lift station project is a gravity expansion project to add additional homes in Detroit Manor Subdivision, will allow new development and eliminate 2 existing lift stations. This would also allow development in the lift station #50 and #387 sewer shed.

\* Additional expenses will be funded from RS 121 (Lift Station Replacement and Upgrade).

### DESCRIPTION:

ECUA's L/S # 307 (Pinebrook Estates) is located in the Pinebrook Estates subdivision. A new 152 lot subdivision, Nowak Dairy, is being proposed to the south of Pine Brook Estates, with sewer proposed to connect to Pinebrook Estates and L/S. This option would assist ECUA with the avoidance of another L/S being built exclusively for Nowak Dairy, but due to L/S # 307's limited pumping and wetwell volume would require a complete rebuild of the L/S. ECUA is negotiating with the developer of Nowak Dairy subdivision on cost-sharing arrangement whereas the developer would cost-participate on the L/S replacement, with ECUA performing the replacement as part of our CIP program. One of the prerequisites for this project to happen will be to find a parcel for the new lift station sites.

LS #6 INDUSTRIES  
LIFT STATION REMOVAL  
AND REPLACEMENT

Map details: The map shows a street grid. S. PACE BLVD runs vertically on the left. BARRANCAS AVE runs diagonally from the top right towards the center. W. MAIN ST and W. GIMBLE ST run horizontally across the middle. PINE ST runs horizontally at the bottom. A thick black line indicates the project route, starting from the top left, passing through a small box labeled 'LS' (LS #6 INDUSTRIES LIFT STATION), and ending at the intersection of S. PACE BLVD and BARRANCAS AVE. A north arrow is in the top right corner.

### DESCRIPTION:

Gravity sanitary sewer pipe replacement of LS 6 Industries. The project extends the 24-inch gravity main in Main Street to the old lift station, abandons duplicative gravity mains, force mains no longer needed, and the existing lift station. Construction is anticipated the fall 2023 through the summer 2024 and additional funding needed will be part of the CAP. Bidding is anticipated to be conducted in FY 23.

### DESCRIPTION:

The existing boardwalk was constructed in 1997 and is maintained by ECUA. The boardwalk is approximately 7740' long x 8' wide and is constructed of southern pressure treated white pine with a structural life of 15 years at most. The boardwalk serves as a nature trail and provides a means for treated effluent to be discharged back into the natural ecosystem. The boardwalk has been maintained over the years by replacing boards as they fail. This peace meal effort is unable to keep up with the rapidly aging structure. Based on the analysis conducted by HMM on the condition of the boardwalk and the decaying condition of the handrail and distribution piping, several repair methods were reviewed and the most cost effective option to properly repair the boardwalk and provide structural reinforcement to the distribution piping is to use Brazillian hardwood (60 year life span) deck planks with an HDPE effluent pipe system including an auxiliary aluminum tray support system as the optimal configuration for construction. This would remove the weight of the effluent distribution piping from the hand rail system and transfer it to the columns supporting the boardwalk. The report is available for review.

### DESCRIPTION:

The Bayou Marcus Water Reclamation Facility (the Facility) is an Advanced Water Treatment (AWT) Facility originally constructed in 1989 and has had several additions and modifications to become the Facility it is today. Over the course of 30 years, the Facility has upgraded process, expanded, and is currently rated for 8.2 million gallons per day (MGD) with discharge to about 1000 acres of wetlands adjacent to the Facility. Recent expansions for hydraulic capacity

Based on current codes, the facilities electrical system does not meet all of the new mandated redundancy/ backup power requirements. This project will develop a master plan and path to implement the following items:

- Two separate and independent sources of electric power shall be provided from either two separate utility substations or from a single substation and an onsite generator.
- The power distribution system is required to be designed such that no single fault or loss of source will result in an extended disruption of electrical service to more than one motor control center associate with the Class I components requiring backup power.
- Vital loads serving the same function are required to be divided as equally as possible between two motor control centers.
- The power distribution needs to be modified to allow inspection and maintenance of individual items without causing a disruption to plant operation.
- The equipment shall be protected from physical damage by the 100-year flood.
  - The Facility must be able to continue running through a 25-year flooding event.
- Control systems whose failure could result in an effluent violation are required to have manual overrides and alarms for failure.
- Critical instrumentation is required to include back up sensors and readouts.
- Where ultraviolet (UV) Disinfection is utilized, the impact of short-term interruptions of electrical service is required to be evaluated for the impact to the system.

### DESCRIPTION:

To conduct corrosion control and repairs to the carbon steel tanks at the Pensacola Beach Plant. Specifically the 2.4 million gallon storage tank, the clear well, the sludge holding tank for both plants and the carbon steel piping associated with the denitrification filter gallery. Replace any corroded bolts and repair damage to the ceramic coating on the steel plates. Additionally, repairs to the anode system, which provides cathodic protection, will also be required. It was determined during the annual inspection that the corrosion of the wind girder on the 2.4 million gallon tank required replacement, pinholeing and the decay of the upper ring were required.

### DESCRIPTION:

This CIP Project was originally created to remove and replace the influent manhole that receives every gallon of wastewater collected on Pensacola Beach. The manhole (hereinafter referred to as MH1) was severely corroded and posed a serious sanitary sewer overflow threat. This project was recently completed in March 2021.

During the excavation of MH1, staff discovered that the effluent line from MH1 to the bar screen is vastly undersized and must be replaced with a line that is equivalent to the 21-inch influent pipe. In addition, there is an abandoned grit chamber downstream of the bar screen that is still utilized as a channel to convey raw wastewater for treatment in Plant 1. The rehabilitation of this grit chamber will also be included in this project.

**DESCRIPTION:**

The Regional Services Department is responsible for the maintenance of the wastewater collection system. There is a 15-inch vitrified clay gravity sewer main on Johnson Avenue that collects the flow from a very large sewer basin that includes an area from Copter Road to Interstate 10 and from University Parkway to Winding Lane. It was discovered that there is a reduction in the size of this gravity sewer main from 15-inch pipe to 10-inch pipe along Johnson Avenue from Tippin Avenue to the intersection of Winding Lane and Bixby Circle. This restriction in flow caused sanitary sewer overflows in the past and is prone to cause the system upstream to surcharge with more flow in excess of its capacity. Regional Services has identified this critical infrastructure as a high priority for replacement. The replacement will reduce the likelihood of future spills due to the known restriction and eliminate the old vitrified clay pipe in the process. The project will consist of complete replacement of the undersized mains and replacement or rehabilitation of the manholes.

### DESCRIPTION:

ECUA has a 20-inch ductile iron force main that runs along Kingsfield Road from Eleven Mile Creek (LS #186) to the transmission force main on Chemstrand Road. There are existing air relief valves (ARV) along this force main that are underground within manhole structures.

ECUA has a transmission force main from Government Street Regional Lift Station to Central Water Reclamation Facility (CWRP) ranging in size from 30-inch to 54-inch. There are smaller manifold force mains that connect to this transmission force main that do not have existing check valves at the connection point.

**DESCRIPTION:**

L/S # 206 located adjacent to 343 Panfario Drive, is in poor condition structurally and is in a flood prone location (within 100' of Santa Rosa Sound). Additionally, a concrete block structure is over the existing wet pit/dry pit wet well, thus maintenance (activities) is difficult and dangerous. Work should consist of constructing a new 8' diameter wet well with new pumps, removal rails, safety grates and raised top to minimize flooding from surcharged conditions. An elevated control platform would be required to allow electrical panels to be installed above the 100-year flood elevation and comply with applicable codes.

### DESCRIPTION:

L/S # 211 (west end of Fort Pickens Rd.) and L/S # 209 (Sabine Drive) currently pump through a common 8" force main on Fort Pickens Rd. and discharge into L/S #207 (Sandollar Condos) which repumps the flow to a manhole on Via De Luna Drive. There is an odor problem at L/S # 207 around the Sandollar Condo complex. Each station on Pensacola Beach has operational, safety, code, etc. issues. Approximately 80 L. F. of 6" force main would be required to accommodate flow from Margaritaville development\*. The proposed project would upgrade/improve L/S's 207,209, and 211.

\*Margaritaville is served by a private lift station that currently manifolds into the 8" FM on Fort Pickens Rd. (serving L/S #207, 209, and 211). To leave Margaritaville connected to this 8" FM, pumps are required to be upgraded. Installing a parallel 6" FM for Margaritaville would ensure proper operation of their current pumps.

### DESCRIPTION:

The 16" D I P force main coming from Montclair L/S # 9 has developed pin-hole leaks on Massachusetts Avenue. Part of this main has been replaced in the past on Herman St. from Pace Blvd. to "L" St. Even though flow from the lift station can be diverted to the Bayou Marcus WRF via the Montclair L/S diversion project (CS141W), for the foreseeable future this line should be maintained as the primary line. Additional information relative to the existing condition of this force main was gathered as part of the Force Main Evaluation. Based on that information, the force main replacement can be pushed out several years.

DESCRIPTION:
<p>The Regional Services Department is responsible for the maintenance of the wastewater collection system. Perdido Bay Country Club is a residential subdivision located off of Sorrento Road between Perdido Bay and Bayou Garcon. Some parts of the gravity sewage collection system in this area was constructed with vitrified clay pipes and brick manholes. Construction first began in the 1960s, so some of this infrastructure is over 60 years old. Due to the age of the collection system, the very high groundwater table, and the condition of the pipes and manholes this area has been identified by Regional Services as a high priority for rehabilitation. The rehabilitation will reduce inflow and infiltration (I &amp; I) by stormwater and groundwater and limit emergency repairs and roadway failures. In recent years, Regional Services has performed multiple emergency projects to repair failing manholes and gravity sewer mains. The project will consist of complete replacement of some mains and manholes as well as rehabilitation of existing mains and manholes when possible.</p>

### DESCRIPTION:

The project is related to the Long Leaf Force Main (FM) which will divert flow from Lift Station (L/S) 41 to the Bayou Marcus Water Reclamation Facility Drainage Basin. Currently a 6" FM along Pine Forest collects sewage from several private lift stations and flows to the Long Leaf Lift Station. The proposed project would upgrade the 10,000 L. F. force main to an 8" line and connect with the Long Leaf FM with flow directed west toward Bayou Marcus.

### DESCRIPTION:

The existing 6" c.a. force main leaving lift station #124 in Sherwood Subdivision has deteriorated to the extent that it is difficult to repair. The top half of the force main is very soft. If action is not taken soon, it may result in a major sewer spill on Fairfield Drive. The amount of pipe to be replaced would be approximately 2,100 L.F. The discharge force main is connected to existing gravity sewer on the south side of Fairfield Drive, thus one major roadway crossing would be required. Removal of the c.a. pipe may be mandatory.

**DESCRIPTION:**

The vacant property between Twisted Oak Drive and Millet Circle has recently been obtained by the County for a regional stormwater pond. ECUA has the opportunity to work with the County to construct a new lift station at the west end of the property to abandon L/S # 371 and L/S # 375 with the addition of approximately 6,000 L. F. of gravity sewer pipe, ECUA could provide sewer service to approximately 90 additional property owners.

The map illustrates the utility relocation project area. A central road is labeled 'LONGLEAF DR'. To its left is 'PINE FOREST RD' and to its right is 'WY MART RD'. Further right is 'KEMP RD'. A callout box points to the intersection area, stating 'PINESTEAD/LONGLEAF UTILITY RELOCATION PHASE 1'. A north arrow is located in the upper right corner of the map.

**DESCRIPTION:**

Escambia County had been planning on 4-laning this west section of the Pinestead/Longleaf corridor (Pine Forest Road to Kemp Road) which would require ECUA to have extensive water and gravity sewer relocation. However, the County has been in the process of reducing the scope of this work to drainage, resurfacing and traffic calming. Baskerville - Donovan Inc. (BDI), was the County's original consulting engineer and was under contract to perform ECUA's sewer design through the Task Order that was executed on June 15, 2020 to set up for a future sewer expansion on Community Drive as well as a lift station upgrade at Wymart Road. The County has since terminated their contract with BDI and is using Sigma to design the revised scope of work. The County does not have exact timing of when the project will be bid or start, however, 90% plans have been coordinated with staff. If relocation is required, ECUA will reengage and coordinate with BDI and the County's consultant on the relocation plans. If relocation is expected, and interlocal agreement will need to be executed to reimburse the County for the appropriate relocations.

Map showing the project area with roads: ROLLING HILLS RD, WINGFOOT WAY, W. PINESTEAD RD, KEMP RD, LONGLEAF DR., MELANIE DR., and PENSACOLA BLVD. A callout box indicates the PINESTEAD / LONGLEAF UTILITY RELOCATION area. A north arrow is present in the top right corner.

### DESCRIPTION:

Escambia County is planning on 4-laning this east section of the Pinestead/Longleaf corridor (Kemp Road to Highway 29). ECUA will have extensive utility relocation and possible sewer expansion and possible lift station replacement. The County does not have exact timing of when the project will be bid, start or even constructed. ECUA will request 90% plans from County in order to do our own utility relocation design at which time we will ask the County to incorporate design into their roadway plans, and reimburse them for the appropriate relocations.

**DESCRIPTION:**

There is a 16-inch sewage force main that crosses through an Escambia County drainage area near the intersection of Olive Road and Scenic Highway. The force main was constructed with cast iron pipe, which is old, in poor condition, and must be replaced. There have been two substantial sanitary sewer overflows (SSOs) in the past year, which flowed into Pensacola Bay via Skinner Mill Creek. The force main is located in an undeveloped part of the drainage area overgrown with vegetation, then down a steep embankment to a stream bed. It is nearly inaccessible. ECUA has already spent around \$200,000 to make the two emergency repairs due to the size of the pipe, the number of critical lift stations connected to it, the volume of flow, and the extreme difficulty to access its location. Additional concerns include the environmental damage from the SSOs, fines from FDEP, and loss of customer confidence. The outcome of this project will be to install about 1,700 feet of new 16-inch PVC pipe and relocate the force main from the drainage area into Escambia County's right-of-way along Winding Lane where it can be easily accessed when necessary.

**DESCRIPTION:**

In reviewing developer-sponsored system expansions, there are sometimes circumstances when it is beneficial for ECUA to work with the project developer to install larger or deeper lines than required for the developer's project or make other adjustments consistent with ECUA's long term needs. These funds are needed to fund these types of "oversizing" activities.

**DESCRIPTION:**

ECUA Regional Services Department maintains over 1,700 miles of water transmission mains and 1,300 miles of wastewater transmission and collection mains throughout the service area and all of the appurtenances. Heavy mechanical equipment such as excavators, skid steer loaders, and other excavating and earth-moving equipment are essential to maintain existing infrastructure and install new infrastructure efficiently. Other needs include equipment such as bypass pumps, portable light plants, and air compressors. The intent of this CIP project is to establish an annual budget for heavy equipment purchase that will aid in the maintenance, installation, and replacement of infrastructure.

### DESCRIPTION:

ECUA has lift stations, manholes, sewer mains, water mains, and other infrastructure that are located in undeveloped areas where access is limited by overgrowth of vegetation or unmaintained access roads. Some of these facilities are located within easements where the rights of access are unclear. This project provides funds to pay for contractors or equipment needed to clear and access areas that have become overgrown with vegetation. It provides funds for the construction and/or maintenance of roads to access these areas. It also provides funds for the review of documents that describe access rights, title searches, surveys, and purchase of property or easements as needed to access active facilities.

### DESCRIPTION:

The building will have room to store 2 - valve insertion trailers, and accessories, 2 Case backhoes, one double axle trailer and a Mini Excavator (Kubota) with trailer. It will also have room for repair parts for fire hydrants and water meters and other repair parts. The purpose of the pre-engineered metal building is to serve as a garage for equipment and service vehicles and critical inventory. Keeping this equipment from UV exposure and the weather in general will prolong all of the equipment's useful life.

Characteristics for the buildings are:

- \* 75' x 60' with three 12' x 18' roll up doors on the north side and five 12' x 18' roll up doors on the south side and one 3' door on the east side.
- \* 22' clear height to lowest structural member on the east and west faces.
- \* Metal roofing with insulation.
- \* Metal siding on all faces of the building with insulation.
- \* Spread foundations.
- \* Interior slab on grade.
- \* Interior lighting.
- \* Exterior lighting on the face of the building.

### DESCRIPTION:

Due to recent significant changes in utility rates, especially electrical power, the cost to operate the major building has increased. The availability of more efficient equipment and/or modifications of the control systems offer the opportunity to reduce energy costs, and provide more reliable facilities. The HVAC systems in the Customer Service Building, the Water Quality Laboratory, and the Administration/Operations/Maintenance Building are potential candidates for reducing energy costs. Those where a reasonable payback period can be demonstrated would progress through detailed design, bidding and implementation.

In addition, this project will evaluate the geothermal system and repair or replace the HVAC equipment in the customer service/ Engineering building.

### DESCRIPTION:

The scope for this project involves replacing the electrical panels and original SCADA RTU's at various lift stations and water wells because of deterioration / age and components reaching their end of life. This program is an on-going program to update or replace this key infrastructure as needed and ensure all electrical panels meet current electrical codes and arc flash requirements. This allows for more efficient troubleshooting and repair and reduce the types of spare parts required. The electrical panels are exposed to weather and initially were built for the pumps installed at the time of construction. An average electrical panel will last 10 to 15 years. With over 30 water wells and 390 lift stations in our system we must continually evaluate and upgrade these panels as needed.

**DESCRIPTION:**

This Project provides funding for the renewal and replacement of ECUA fleet vehicles and heavy equipment. An expected life span is assigned to each vehicle when it is purchased, based on the type of service it will provide. This replacement schedule was originally developed as a straight projection of the expected life span, using 5% increase in the cost of new vehicles each year. The ECUA replaces equipment based upon condition, annual costs of repairs and expectancy.

**DESCRIPTION:**

ECUA has a transmission force main from Government Street Regional Lift Station to Central Water Reclamation Facility (CWRP) ranging is size from 30-inch to 54-inch. ECUA has a Transmission Main Interruption Plan (TMIRP) in case this vital force main is damaged. The intent of this CIP project is to establish an annual budget for TMIRP material purchase that will aid in the maintenance and/or repair of the transmission force main. The TMIRP materials will include, but are not limited to, pipe, fittings, valves, clamps, sleeves, coatings, and equipment. This funding will allow ECUA to keep in-stock these long-lead time items in case an emergency occurs.

### DESCRIPTION:

To set aside funds in order to construct new loading docks and storage capacity at the MRF.

To design and construct two additional permanent loading docks and covered storage at the MRF.

This project will provide funding to design and construct two additional concrete loading docks and covered storage for baked recyclables. Currently the MRF has one permanent loading dock and one portable loading dock. This limits the MRF's ability to load outbound semi-trailer to approximately 10 per day. The additional permanent loading docks are projected to increase loading capacity of approximately 24 semi-trailers a day, which will expedite shipment of recyclables from the MRF.
